

Elementary Particles I

2 – Electromagnetic Interaction

Form Factors, Structure Functions, Scaling, Partons

Leptons

Leptons

1st family	2nd family	3rd family
$\nu_e, \bar{\nu}_e$	$\nu_\mu, \bar{\nu}_\mu$	$\nu_\tau, \bar{\nu}_\tau$
e^-, e^+	μ^-, μ^+	τ^-, τ^+

Neutral, ‘Massless’

Charged, Massive

“Pointlike”, spin $1/2$ Fermions

Electromagnetic and weak interactions

Lepton scattering by several targets as a powerful tool to probe constituents:

Electromagnetic (and weak) coupling to leptons simple, well understood

Small coupling constant → Perturbative expansion reliable

Electromagnetic Interaction

Try to find transition amplitude for electromagnetic scattering

1st order perturbative contribution

$$T_{fi} = -i \langle f | \int d^4x H' | i \rangle \quad H': \text{Interaction Hamiltonian density}$$

$$H' = j^\mu A_\mu \quad \text{Classical analogy, } j_\mu \text{ current 4-density}$$

Reminder

For any system of charges and currents:

$$u_E = \frac{1}{2} \rho \varphi \quad \text{Electrostatic potential energy density}$$

$$u_B = \frac{1}{2} \mathbf{j} \cdot \mathbf{A} \quad \text{Magnetostatic potential energy density}$$

$$j^\mu = (\rho, \mathbf{j}) \quad \text{4-current density}$$

$$A_\mu = (\varphi, \mathbf{A}) \quad \text{4-potential}$$

An oversimplified example - I

First take a simple example:

Spinless, pointlike “pion” scattering off a fixed, Coulomb potential

$$A_\mu = \left(\frac{eZ}{r}, \mathbf{0} \right)$$

$$j^\mu = (\rho, \mathbf{j}) = ie \left(\varphi^* \left(\frac{\partial \varphi}{\partial t} \right) - \left(\frac{\partial \varphi^*}{\partial t} \right) \varphi, ((\nabla \varphi^*) \varphi - \varphi^* (\nabla \varphi)) \right)$$

$$j^\mu = (\rho, \mathbf{j}) = ie \left(\varphi'^* \left(\frac{\partial \varphi}{\partial t} \right) - \left(\frac{\partial \varphi'^*}{\partial t} \right) \varphi, ((\nabla \varphi'^*) \varphi - \varphi'^* (\nabla \varphi)) \right)$$

$$\rightarrow j^\mu = eNN' e^{-i((E-E')t-(\mathbf{p}-\mathbf{p}')\cdot\mathbf{r})} ((E+E'), (\mathbf{p}'+\mathbf{p}))$$

$$\rightarrow j^\mu A_\mu = NN' (E+E') e^{-i((E-E')t-(\mathbf{p}-\mathbf{p}')\cdot\mathbf{r})} \frac{e^2 Z}{r}$$

Integrate over time:

$$\int_{-\infty}^{+\infty} NN' e^{i(E-E')t} dt = NN' 2\pi \delta(E - E')$$

Usual definition of current density
 ϕ : Stationary state

Generalize to a scattering state
 ϕ, ϕ' : Stationary states, plane waves

Energy conservation; momentum
not conserved by fixed Coulomb
potential

An oversimplified example - II

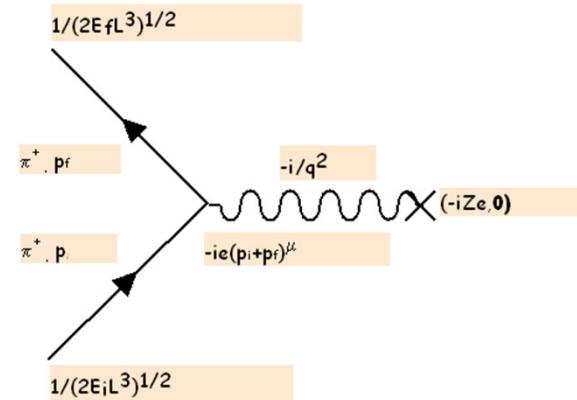

Integrate over space:

$$\int e^{+i(\mathbf{p} \cdot \mathbf{p}') \cdot \mathbf{r}} \frac{e^2 Z}{r} d^3 \mathbf{r} = \frac{4\pi Z e^2}{|\mathbf{q}|^2}, \mathbf{q} = \mathbf{p} - \mathbf{p}'$$

Matrix element:

$$T_{fi} = -i \langle f | \int d^4x H' | i \rangle = -NN' 2\pi i \delta(E - E') \frac{4\pi Z e^2}{|\mathbf{q}|^2}$$

$$E = E' \rightarrow |\mathbf{q}|^2 = -q^2 \rightarrow T_{fi} = NN' 2\pi i \delta(E - E') \frac{4\pi Z e^2}{q^2}$$

Virtual photon:

Coupling fixed source to current

An oversimplified example - III

Evaluate transition probability

$$w = \frac{|T_{fi}|^2}{T} \quad \text{Transition probability/Time}$$

$$|\delta(E' - E)|^2 = \lim_{T \rightarrow \infty} \left| \frac{1}{2\pi} \int_{-T/2}^{+T/2} e^{i(E'-E)t} dt \right|^2 = \lim_{T \rightarrow \infty} \left| \frac{\sin[(E' - E)T/2]}{\pi(E' - E)} \right|^2 = \frac{T}{2\pi} \delta(E' - E)$$

$$w = N^2 N'^2 \frac{4\pi^2}{T} |\delta(E - E')|^2 \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} = N^2 N'^2 2\pi \delta(E - E') \frac{Z^2 e^4}{|\mathbf{q}|^4}$$

$$\rightarrow d\sigma = w \cdot \frac{\text{phase space}}{\text{incident flux}} = w \frac{\frac{Vd^3 p'}{(2\pi)^3}}{\frac{p}{EV}} = w \frac{d^3 p'}{(2\pi)^3} \frac{E}{p} V^2$$

$$d\sigma = N^2 N'^2 2\pi \delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{d^3 p'}{(2\pi)^3} \frac{E}{p} V^2$$

$$N = N' = \frac{1}{\sqrt{V}} \rightarrow d\sigma = \frac{1}{V} \frac{1}{V} 2\pi \delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{d^3 p'}{(2\pi)^3} \frac{E}{p} V^2 = 2\pi \delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{d^3 p'}{(2\pi)^3} \frac{E}{p}$$

An oversimplified example - IV

Calculate differential cross-section

$$\int d\sigma = \int 2\pi\delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{d^3 p'}{(2\pi)^3} \frac{E}{p}$$

$$d^3 p' = p'^2 dp' d\Omega$$

$$p' dp' = E' dE' \rightarrow d^3 p' = p' E' dE' d\Omega$$

$$\rightarrow \int 2\pi\delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{d^3 p'}{(2\pi)^3} \frac{E}{p} = \int 2\pi\delta(E - E') \frac{16\pi^2 Z^2 e^4}{|\mathbf{q}|^4} \frac{dE'}{(2\pi)^3} \frac{E}{p} p' E' d\Omega$$

$$= \frac{1}{(2\pi)^2} \frac{Z^2 e^4}{|\mathbf{q}|^4} \frac{E}{p} p' \int \delta(E - E') dE' E' d\Omega = \frac{1}{(2\pi)^2} \frac{Z^2 e^4}{|\mathbf{q}|^4} E^2 d\Omega$$

$$q = 2p \sin \frac{\theta}{2} \rightarrow q^4 = 16p^4 \sin^4 \frac{\theta}{2}$$

$$\rightarrow \frac{d\sigma}{d\Omega} = \frac{1}{(2\pi)^2} \frac{16\pi^2 Z^2 e^4}{16p^4 \sin^4 \theta/2} E^2 = \frac{1}{4} Z^2 \alpha \left(\frac{E^2}{p^4} \right) \frac{1}{\sin^4 \theta/2}$$

Useful to remember

$$E^2 = \mathbf{p}^2 + m^2$$

$$\rightarrow 2EdE = 2|\mathbf{p}|d|\mathbf{p}|$$

$$\rightarrow EdE = |\mathbf{p}|d|\mathbf{p}|$$

Compare to non-relativistic Rutherford cross-section:

$$\frac{d\sigma}{d\Omega} = \frac{1}{4} Z^2 \alpha^2 \left(\frac{1}{T^2} \right) \frac{1}{\sin^4 \theta/2}$$

Theme Variation: Spin $1/2$ - I

Take now a spin $1/2$ Dirac electron scattering off the same, static Coulomb potential

$$j^\mu = e\bar{\psi}' \gamma^\mu \psi$$

Dirac transition current

$$\rightarrow \psi = \sqrt{\frac{m}{E}} u(s, p) e^{ipx}, \bar{\psi}' = \sqrt{\frac{m}{E}} \bar{u}(s', p') e^{-ip'x}$$

$$\rightarrow j^\mu = e \sqrt{\frac{m}{E}} \bar{u}(s', p') e^{-ip'x} \gamma^\mu \sqrt{\frac{m}{E}} u(s, p) e^{ipx} = e \frac{m}{E} e^{-i(p-p')x} \bar{u} \gamma^\mu u$$

$$j^\mu A_\mu = e \frac{m}{E} e^{-i((E-E')t-(\mathbf{p}-\mathbf{p}')\cdot \mathbf{r})} \bar{u}(s', p') \gamma^\mu u(s, p) \left(\frac{eZ}{r}, \mathbf{0} \right) = e \frac{m}{E} e^{-i((E-E')t-(\mathbf{p}-\mathbf{p}')\cdot \mathbf{r})} \bar{u} \gamma^0 u \frac{eZ}{r}$$

$$\underbrace{\bar{u}(s', p') \gamma^0 u(s, p)}_{=u^\dagger \gamma^0} = u^\dagger(s', p') \overline{\gamma^0 \gamma^0} \stackrel{=1}{=} u^\dagger(s', p') u(s, p) \quad \text{Dirac matrices}$$

$$\frac{d\sigma}{d\Omega} = \frac{m^2}{E^2} \frac{Z^2 e^4}{16(2\pi)^2} \frac{E^2}{p^4} \frac{1}{\sin^4 \theta/2} |u^\dagger(s', p') u(s, p)|^2 = \frac{1}{4} \frac{m^2}{p^4} Z^2 \alpha^2 \frac{1}{\sin^4 \theta/2} |u^\dagger(s', p') u(s, p)|^2$$

Theme Variation: Spin $1/2$ - II

Unpolarized cross-section:

*Sum over final
spin projections*
Average over initial

$$\frac{1}{2} \sum_{s=-1/2}^{+1/2} \sum_{s'=-1/2}^{+1/2} |u^\dagger(s', p') u(s, p)|^2 = 4 \frac{E^2}{m^2} (1 - \beta^2 \sin^2 \theta/2)$$

$$\rightarrow \frac{d\sigma}{d\Omega} = \frac{1}{4} Z^2 \alpha^2 \frac{m^2}{p^4} \frac{1}{\sin^4 \theta/2} \frac{4E^2}{m^2} (1 - \beta^2 \sin^2 \theta/2) = \frac{1}{4} Z^2 \alpha^2 \frac{E^2}{p^4} \frac{(1 - \beta^2 \sin^2 \theta/2)}{\sin^4 \theta/2}$$

$$\frac{d\sigma}{d\Omega} \underset{E \gg m}{\simeq} \frac{1}{4} Z^2 \alpha^2 \frac{E^2}{p^4} \frac{\cos^2 \theta/2}{\sin^4 \theta/2}$$

New factor, important at high speed
Reducing cross section at large angles ($= 0$ for $\theta \rightarrow \pi$)

Helicity Conservation

Dirac equation: High energy limit

$$E\psi = (\mathbf{a} \cdot \mathbf{p} + \beta m)\psi$$

$$u = \begin{pmatrix} \phi \\ \chi \end{pmatrix} \quad \text{Generic spinor; } \phi, \chi \text{ 2-components spinors}$$

$$\mathbf{a} = \begin{pmatrix} \boldsymbol{\sigma} & 0 \\ 0 & -\boldsymbol{\sigma} \end{pmatrix}, \beta = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} \quad \text{Dirac matrices, chiral representation, "2x2" block format}$$

$$\begin{cases} E\phi = (\boldsymbol{\sigma} \cdot \mathbf{p})\phi + m\chi \\ E\chi = -(\boldsymbol{\sigma} \cdot \mathbf{p})\chi + m\phi \end{cases}$$

$$\left. \begin{array}{l} E \gg m \rightarrow E \approx |\mathbf{p}| \\ m \approx 0 \end{array} \right\} \rightarrow \left. \begin{array}{l} (\boldsymbol{\sigma} \cdot \mathbf{p})\phi \approx |\mathbf{p}|\phi \\ (\boldsymbol{\sigma} \cdot \mathbf{p})\chi \approx -|\mathbf{p}|\chi \end{array} \right\} \rightarrow \left. \begin{array}{l} \phi \simeq u_R \\ \chi \simeq u_L \end{array} \right\} \rightarrow u \approx \begin{pmatrix} u_R \\ u_L \end{pmatrix} \rightarrow u^\dagger(s', p') u(s, p) \approx u_R^\dagger u_R + u_L^\dagger u_L$$

No mixed terms \rightarrow *Helicity is conserved at high energy*

Explains the $(1 - \beta^2 \sin^2 \theta/2)$ factor, cutting off the cross-section $\theta \rightarrow \pi$

Solves conflicting helicity/angular momentum conservation

Always true for Dirac currents coupling to vector fields

Another Step into a Realistic Model

Take now a spin $1/2$ Dirac electron scattering off a *distributed*, static source (like a (A,Z) nucleus)

$$A_\mu = (\varphi, \mathbf{0})$$

$$\varphi(r) = \int d^3\mathbf{r}' \frac{\rho(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}, \quad \int \rho(\mathbf{r}') d^3\mathbf{r}' = Ze$$

Only change: the space integral

$$\int e^{+i((\mathbf{p} \cdot \mathbf{p}') \cdot \mathbf{r})} \frac{e^2 Z}{r} d^3\mathbf{r} = \frac{4\pi Ze^2}{|\mathbf{q}|^2}, \quad \mathbf{q} = \mathbf{p} - \mathbf{p}' \rightarrow \int d^3\mathbf{r} \int e^{+i((\mathbf{p} \cdot \mathbf{p}') \cdot \mathbf{r})} \frac{\rho(\mathbf{r}')}{|\mathbf{r}' - \mathbf{r}|} d^3\mathbf{r}'$$

$$= \int d^3\mathbf{r}' \frac{\rho(\mathbf{r}')}{Ze} e^{+i(\mathbf{p} \cdot \mathbf{p}') \cdot \mathbf{r}'} \int e^{+i((\mathbf{p} \cdot \mathbf{p}') \cdot (\mathbf{r} - \mathbf{r}'))} \frac{Ze}{|\mathbf{r}' - \mathbf{r}|} d^3\mathbf{r}'$$

$$F(\mathbf{q}) = \frac{\int \rho(\mathbf{r}) e^{+i\mathbf{q} \cdot \mathbf{r}} d^3\mathbf{r}}{Ze} \quad \text{Form factor of the charge distribution}$$

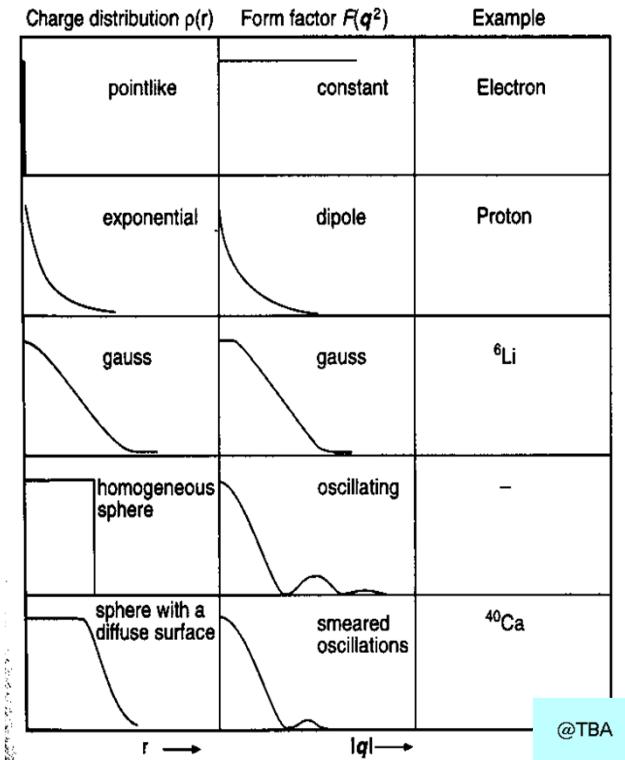

$$\Rightarrow \frac{Z^2 e^2}{|\mathbf{q}|^4} \rightarrow \frac{Z^2 e^2}{|\mathbf{q}|^4} |F(\mathbf{q})|^2$$

The Form Factor

$$\begin{aligned}
F(\mathbf{q}) &= \frac{\int \rho(\mathbf{r}) e^{+i\mathbf{q}\cdot\mathbf{r}} d^3\mathbf{r}}{Ze} = \frac{1}{Ze} \int \rho(r) e^{+iqr\cos\theta} r^2 dr d\Omega \\
e^{+i|\mathbf{q}|r\cos\theta} &= 1 + i|\mathbf{q}|r\cos\theta - \frac{1}{2}|\mathbf{q}|^2 r^2 \cos^2\theta \dots \\
&\rightarrow \frac{1}{Ze} \int \rho(r) e^{+i|\mathbf{q}|r\cos\theta} r^2 dr d\Omega \approx \\
&\approx \frac{1}{Ze} \left[\int \rho(r) r^2 dr d\Omega + i|\mathbf{q}| \int \rho(r) r^3 \cos\theta dr d\Omega - \frac{|\mathbf{q}|^2}{2} \int \rho(r) r^4 \cos^2\theta dr d\Omega \right] \\
\rightarrow F(\mathbf{q}) &\approx 1 + \frac{i|\mathbf{q}|}{Ze} \int \rho(r) r^3 dr \underbrace{\int \cos\theta dr d\Omega}_{=\frac{2\pi}{2}(-\cos^2\theta)\Big|_0^\pi = 0} - \frac{|\mathbf{q}|^2}{2Ze} \int \rho(r) r^4 dr \underbrace{\int \cos^2\theta dr d\Omega}_{=\frac{Ze\langle r^2 \rangle}{4\pi}} = 1 - \frac{|\mathbf{q}|^2 \langle r^2 \rangle}{6} \\
F(|\mathbf{q}|^2) &= F(0) + \frac{\partial F}{\partial |\mathbf{q}|^2} |\mathbf{q}|^2 + \dots \\
F(|\mathbf{q}|^2) &\approx 1 - \frac{1}{6} |\mathbf{q}|^2 \langle r^2 \rangle
\end{aligned}
\right\} \rightarrow \rightarrow \left\{
\begin{array}{l}
F(0) = 1 \\
\langle r^2 \rangle = -6 \frac{\partial F}{\partial |\mathbf{q}|^2} \Big|_{|\mathbf{q}|^2=0}
\end{array}
\right.$$

showing that measuring the form factor yields the rms charge radius

FF: The Mathematical Game

$$\rho(r) = \frac{1}{8\pi a^3} e^{-ar} \rightarrow F(|\mathbf{q}|^2) = \left(\frac{1}{1 + |\mathbf{q}|^2/a^2} \right)^2$$

$$\rho(r) = \begin{cases} \text{constant } r < R \\ 0 \quad r > R \end{cases} \rightarrow F(|\mathbf{q}|^2) = \frac{3}{R^3 |\mathbf{q}|^3} (\sin(R|\mathbf{q}|) - R|\mathbf{q}| \cos(R|\mathbf{q}|))$$

The momentum slit box and part of the vacuum chamber are shown between the magnets.

Nuclear Form Factors - III

From counting rate to cross section:

$$dn = -n(z)n_T\sigma dz \rightarrow |\Delta n| \simeq n_0 n_T \sigma \Delta z, \Delta n \ll n_0$$

$$n_T = \frac{\rho_T}{A} N_A \rightarrow |\Delta n| \simeq n_0 \rho_T \frac{N_A}{A} \sigma \Delta z$$

$$\rightarrow \sigma = \frac{1}{N_A} \frac{A}{\rho_T \Delta z} \frac{\Delta n}{n_0}, \Delta n \ll n_0, \Delta z \text{ small}$$

What is known:

Beam energy
Scattering angle

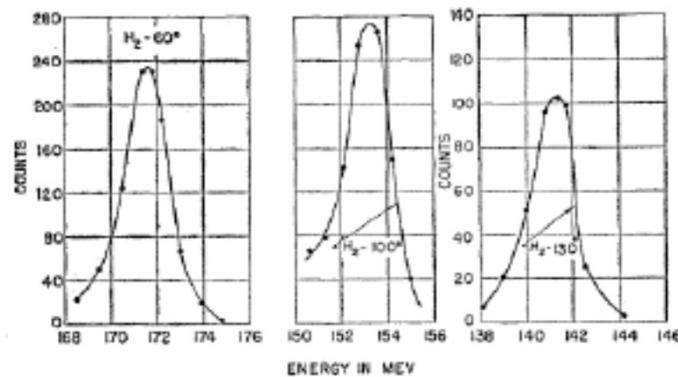

of incident beam particles, n_0
of scattering events, Δn
Target thickness, Δz
Target mass density, ρ_T

Count scattering events, count beam particles, measure target
→ Get σ

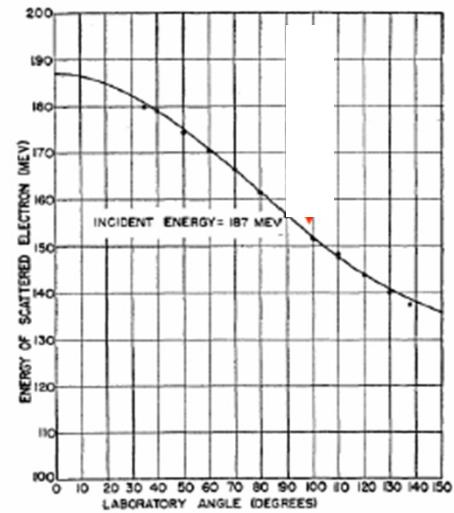

Nuclear Form Factors - IV

Elastic nuclear scattering

Count rate vs energy at different angles:
Elastic peak

Scattered electron energy vs angle:
2-body kinematics

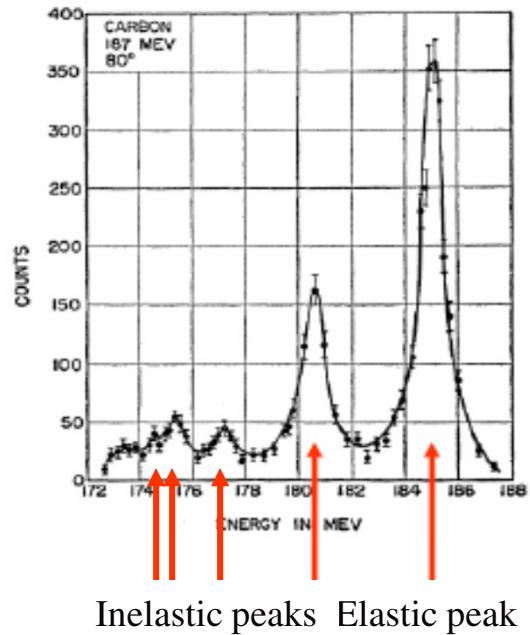

$$\frac{E'_e}{E_e} = \frac{1}{1 + 2 \frac{E_e}{m_N} \sin^2 \frac{\theta}{2}}$$

Nuclear Form Factors - V

Inelastic nuclear scattering:

Count rate vs energy at fixed angle
Excitation of ^{12}C nuclear levels

Scattered electron energy vs angle:
>2 body kinematics

$$\frac{E_e'}{E_e} = \frac{1 - \frac{\Delta m^2}{2m_N E_e}}{1 + 2 \frac{E_e}{m_N} \sin^2 \frac{\theta}{2}}$$

The ‘Nuclear Parton Model’

Particle-Particle Scattering

1st order Transition amplitude:

$$H' = j^\mu A_\mu \rightarrow H' = (j_1^\mu + j_2^\mu) A_\mu$$

$$\rightarrow M_{fi} = i(2\pi)^4 \delta(p_1 + p_2 - (p_1' + p_2')) T_{fi} = i(2\pi)^4 \delta(p_1 + p_2 - (p_1' + p_2')) j_\mu^{(1)} \frac{ig^{\mu\nu}}{q^2} j_\nu^{(2)}$$

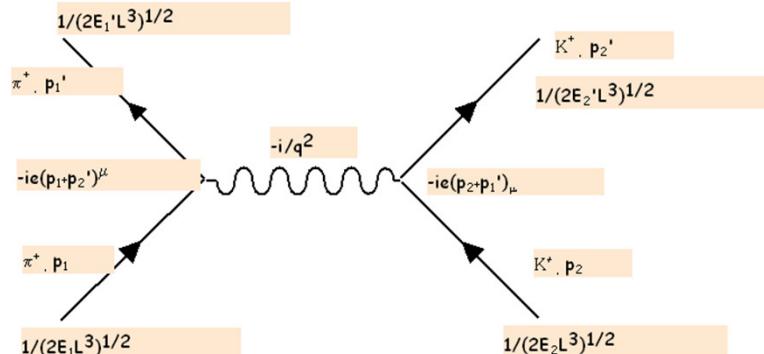

$q = p_1 - p_1' = p_2 - p_2'$ 4-momentum transfer

Transition currents:

$$j^\mu = e(p_1 + p_3)^\mu \quad \text{scalar}$$

$$j^\mu = e\bar{u}_4 \gamma^\mu u_2 \quad \text{fermion}$$

.....

Scattering Spin 0 – Spin 1/2

Just take the two currents as defined before: Another extension of Rutherford cross section
Includes *target recoil*

$$T_{fi} = e\bar{u}' \gamma^\mu u \frac{g_{\mu\nu}}{q^2} e(p + p')^\nu \rightarrow d\sigma = \frac{1}{4EE'v} |T_{fi}|^2 (2\pi)^4 \delta^4(p_1' + p_2' - p_1 - p_2) \frac{1}{(2\pi)^3} \frac{1}{(2\pi)^3} \frac{d^3\mathbf{p}_1'}{2E_1'} \frac{d^3\mathbf{p}_2'}{2E_2'} \\ \frac{1}{2} \sum_{s=-1/2}^{+1/2} \sum_{s'=-1/2}^{+1/2} |T_{fi}|^2 = \left(\frac{e^2}{q^2}\right)^2 \frac{1}{2} \sum_{s,s'=-1/2}^{+1/2} \bar{u}(p_1', s') \gamma^\mu u(p_1, s) \bar{u}(p_1, s) \gamma^\nu u(p_1', s') (p_2 + p_2')_\mu (p_2 + p_2')_\nu$$

By defining...

$$T_{\mu\nu} = (p_2 + p_2')_\mu (p_2 + p_2')_\nu$$

$$L^{\mu\nu} = 2 \left[p_1'^\mu p_1^\nu + p_1'^\nu p_1^\mu + \frac{q^2}{2} g^{\mu\nu} \right]$$

...it can be shown that ← ;-) Not really difficult, just a bit long

$$\frac{d\sigma}{dq^2} = \frac{2\alpha^2}{(p_1 + p_2)^2 q^4} \left[2(p_1 \cdot p_2)(p_1 \cdot p_2') + \frac{q^2}{2} M^2 \right] \quad \text{Invariant cross-section}$$

$$\frac{d\sigma}{d\Omega} \Big|_{LAB} \underset{E \gg m}{\approx} \frac{\alpha^2}{4|\mathbf{p}_1|^2 \sin^4 \theta/2} \cos^2 \frac{\theta}{2} \frac{|\mathbf{p}_1'|}{|\mathbf{p}_1|} \quad \text{LAB = "2" rest frame}$$

The π Form Factor - I

Consider electron-pion scattering: The π is not a point-like object...

What are we to take for the pion current?

Must build a 4-vector operator

Some guesswork:

1) *Lorentz invariance*

$$\left. \begin{array}{l} p_2, p_2', q \quad \text{Three 4-momentum vectors} \\ p_2' = p_2 + q \quad \text{Constraint} \end{array} \right\} \rightarrow 2 \text{ independent}$$

Choose:

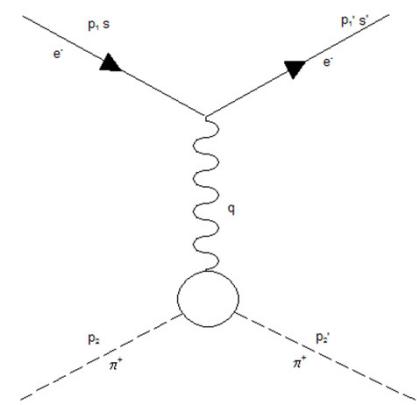

$$\left. \begin{array}{l} p_2' + p \\ p_2' - p = q \end{array} \right\} \text{Both can contribute to the current}$$

Only one independent 4-scalar:

$$\text{E.g. } (p_2')^2 = (p_2)^2 = m^2 \rightarrow p_2 \cdot p_2'$$

Choose instead q^2

$$\rightarrow j_{(\pi)}^\mu = e \left[F(q^2)(p' + p)^\mu + G(q^2)q^\mu \right] e^{-iq \cdot x}$$

Blob indicating a non-QED vertex:
The pion is an extended object

The π Form Factor - II

2) Gauge Invariance

Charge conservation \leftrightarrow Current must be *divergenceless*

$$\begin{aligned}\partial_\mu j^\mu &= 0 \rightarrow \partial_\mu j_\pi^\mu = e\partial_\mu \left[F(q^2)(p' + p)^\mu + G(q^2)q^\mu \right] e^{-iq \cdot x} \\ &= -iq_\mu e \left[F(q^2)(p' + p)^\mu + G(q^2)q^\mu \right] e^{-iq \cdot x} = 0 \\ \rightarrow \partial_\mu j^\mu &= 0 \Rightarrow q_\mu j^\mu = 0 \\ q_\mu \left[F(q^2)(p_2 + p_2')^\mu + G(q^2)q^\mu \right] &= 0 \\ q_\mu (p_2 + p_2')^\mu &= (p_2 - p_2)_\mu (p_2 + p_2')^\mu = 0 \\ q_\mu q^\mu &\neq 0 \\ \rightarrow j^\mu &= e(p_2 + p_2')^\mu F(q^2)\end{aligned}$$

Just *one* form factor for a scalar particle like the π

The π Form Factor - III

What is $F(q^2)$?

In the CM frame:

$$q^2 = (E' - E, \mathbf{p}' - \mathbf{p})^2 = (E' - E)^2 - (\mathbf{p}' - \mathbf{p})^2 = 0 - \mathbf{q}^2 = -|\mathbf{q}|^2$$

$$\rightarrow F_{scatt}(q^2) = F_{scatt}(|\mathbf{q}|^2)$$

Again, Fourier transform of the charge distribution

If crossing is good, can extend to the reaction

$$q^2 = (E_1 + E_2, \mathbf{p}_1 + \mathbf{p}_2)^2 = (E_1 + E_2)^2 - (\mathbf{p}_1 + \mathbf{p}_2)^2$$

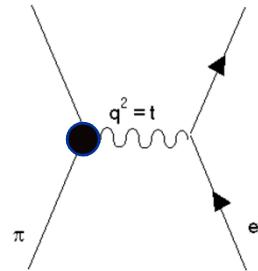

$$q^2 = E_{CM}^2$$

$$\rightarrow F_{annihil}(q^2) = F_{annihil}(E_{CM}^2)$$

$$\rightarrow F(q^2) = \begin{cases} F_{scatt}(q^2), & q^2 < 0 \\ F_{annihil}(q^2), & q^2 > 0 \end{cases}$$

Experiments – Space-like

π scattering off electrons

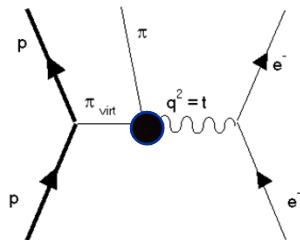

$$p^* = \frac{p_\pi m_e}{\sqrt{s}} \rightarrow t_{\max} = -4 \frac{p_\pi^2 m_e^2}{s} = -4 \frac{p_\pi^2 m_e^2}{m_\pi^2 + m_e^2 + 2E_\pi m_e} \approx -4 \frac{p_\pi^2 m_e^2}{m_\pi^2 + 2E_\pi m_e}$$

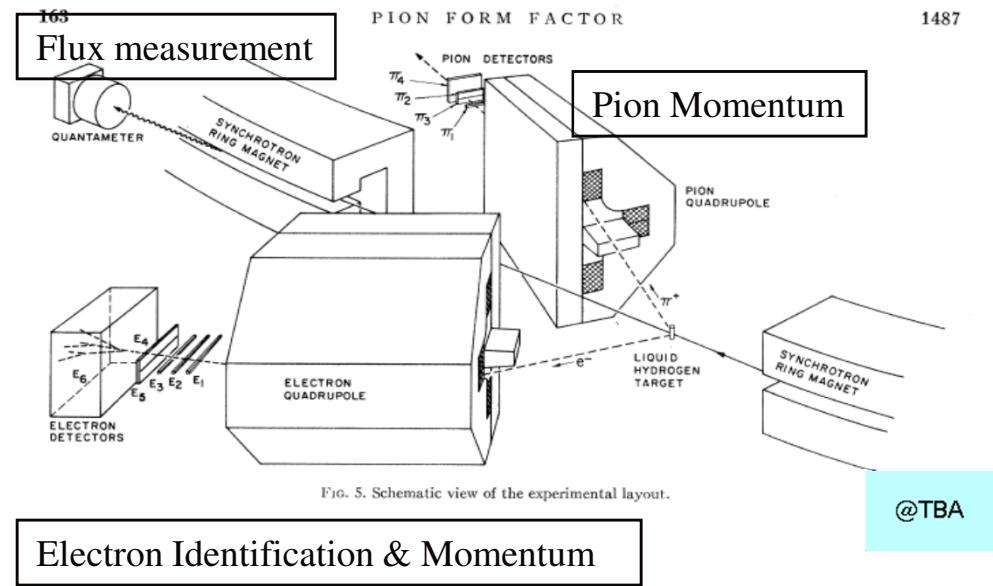

$$\rightarrow t_{\max} \underset{p_\pi \rightarrow \infty}{\sim} -4 \frac{p_\pi m_e^2}{2m_e} = -2p_\pi m_e$$

Unappealing, t_{\max} too small

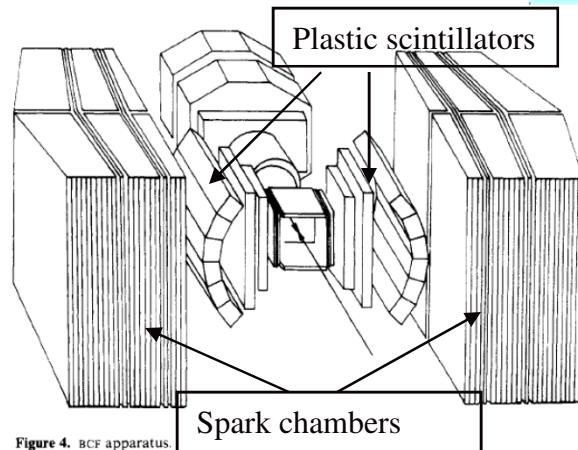

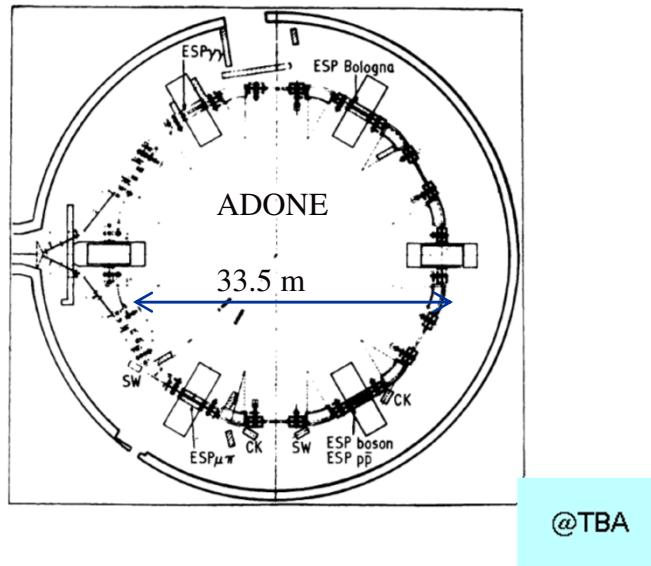

Electroproduction of one π

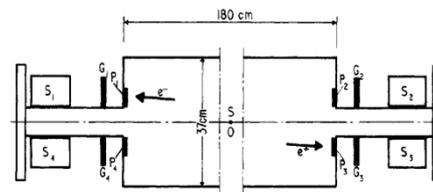

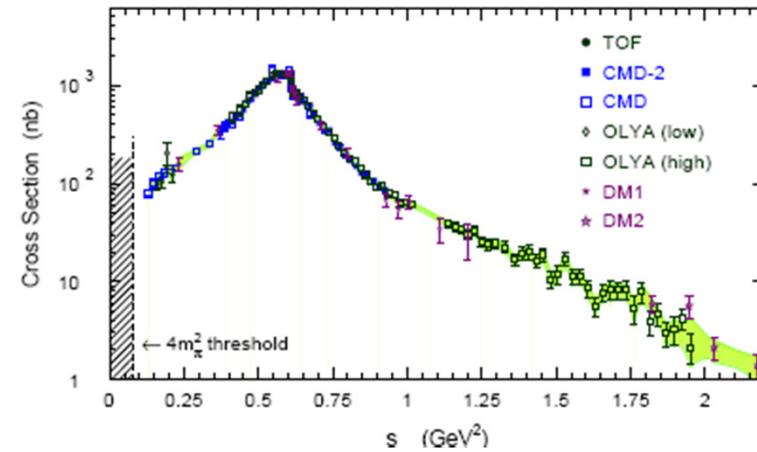

OK

Experiments – Time-like

First $e^+ - e^-$ colliding beams
ADONE – Frascati, 1967 etc.

Luminosity monitor measures Bhabha scattering rate
at small angles: α = acceptance

$$Rate_{Bhabha} = \sigma_{Bhabha} \cdot \alpha \cdot Luminosity$$

$e^+ + e^- \rightarrow e^+ + e^-$ pure QED at low energy, small angle

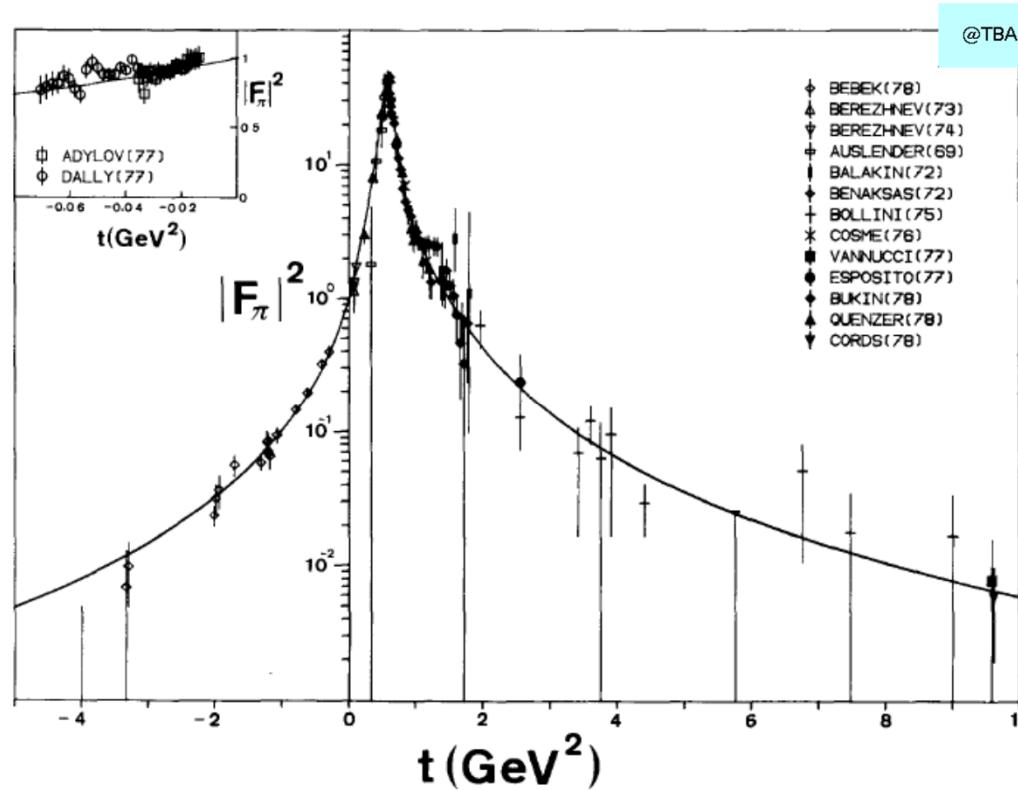

→ accurate, reliable σ_{Bhabha} prediction

$$\rightarrow Luminosity = Rate_{Bhabha} / (\sigma_{Bhabha} \cdot \alpha)$$

The π Form Factor at Large

Is there a unique function $F(q^2)$? Yes!

Good check of crossing

Electron Form Factors - I

$$j^\mu = e\bar{\psi}\gamma^\mu\psi \quad \text{Dirac current}$$

$$\bar{u}(p')\gamma^\mu u(p) = \frac{1}{2m} \left[(p+p')^\mu + i\sigma^{\mu\nu} (p-p')_\nu \right] \quad \text{Gordon's identity}$$

$$\begin{cases} \frac{e}{2m} u(p')(p+p')^\mu u(p) & \text{charge, like a scalar particle} \\ \frac{ie}{2m} \bar{u}(p') \underbrace{\sigma^{\mu\nu} (p-p')_\nu}_{=q_\nu} u(p) & \text{extra term} \end{cases}$$

Extra term due to *magnetic dipole current*.

Indeed, it contributes the interaction energy:

$$\frac{ie}{2m} \bar{u}(p') \sigma^{\mu\nu} u(p) q_\nu A_\mu \xrightarrow{\text{low speed}} -\frac{e}{2m} \phi^{\dagger} \boldsymbol{\sigma} \cdot (\mathbf{q} \times \mathbf{A}) \phi \quad \text{Magnetic dipole interaction energy}$$

$$\frac{e}{2m} \phi^{\dagger} \boldsymbol{\sigma} \cdot (\nabla \times \mathbf{A}) \phi \equiv \frac{e}{2m} \phi^{\dagger} (\boldsymbol{\sigma} \cdot \mathbf{B}) \phi \Rightarrow \frac{ie}{2m} \bar{u}(p') \sigma^{\mu\nu} u(p) q_\nu A_\mu \xrightarrow{\text{low speed}} -\frac{e}{2m} \phi^{\dagger} (\boldsymbol{\sigma} \cdot \mathbf{B}) \phi$$

$$\mu \approx \frac{e\hbar}{2mc} \quad \text{Magnetic moment}, \quad j = \frac{1}{2}\hbar \quad \text{Spin}, \quad \gamma \equiv \frac{\mu}{j} \quad \text{Gyromagnetic ratio}$$

$$\gamma \approx \frac{e\hbar}{2mc} \frac{2}{\hbar \underset{\text{natural units}}{\text{units}}} = \frac{e}{2m} \cdot 2, \quad \text{Define } \gamma \equiv g \frac{e}{2m} \rightarrow g \approx 2 \quad \text{Dirac } g\text{-factor}$$

Electron Form Factors - II

Now: g -factor not exactly 2, as predicted by Dirac equation

Reason: *Radiative corrections*

Largest correction: Anomalous magnetic moment

$$\mu_{Dirac} = \frac{e}{2m} \rightarrow \mu = \frac{e}{2m} (1 + \kappa_e)$$

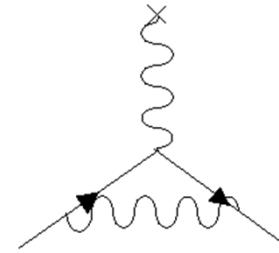

$$j^\mu = \frac{e}{2m} \bar{u}(p') \left[(p + p')^\mu + i\sigma^{\mu\nu} (1 + \kappa_e) q_\nu \right] u(p)$$

$$\bar{u}(p') \gamma^\mu u(p) = \frac{1}{2m} \bar{u}(p') \left[(p + p')^\mu + i\sigma^{\mu\nu} q_\nu \right] u(p)$$

$$\rightarrow \bar{u}(p') (p + p')^\mu u(p) = \bar{u}(p') (\gamma^\mu - i\sigma^{\mu\nu} q_\nu) u(p)$$

$$\rightarrow j^\mu = \frac{e}{2m} \bar{u}(p') \left[\gamma^\mu - i\sigma^{\mu\nu} q_\nu + i\sigma^{\mu\nu} (1 + \kappa_e) q_\nu \right] u(p)$$

$$\rightarrow j^\mu = \frac{e}{2m} \bar{u}(p') \left[\gamma^\mu + i\kappa_e \sigma^{\mu\nu} q_\nu \right] u(p)$$

In spite of the electron *being* a pointlike fermion, radiative corrections make it behaving like an extended object

Further radiative corrections lumped into 2 *form factors*

$$j^\mu = \frac{e}{2m} \bar{u}(p') \left[f(q^2) \gamma^\mu + g(q^2) i\kappa_e \sigma^{\mu\nu} q_\nu \right] u(p) \text{ Most general form}$$

$g-2$ - Theory

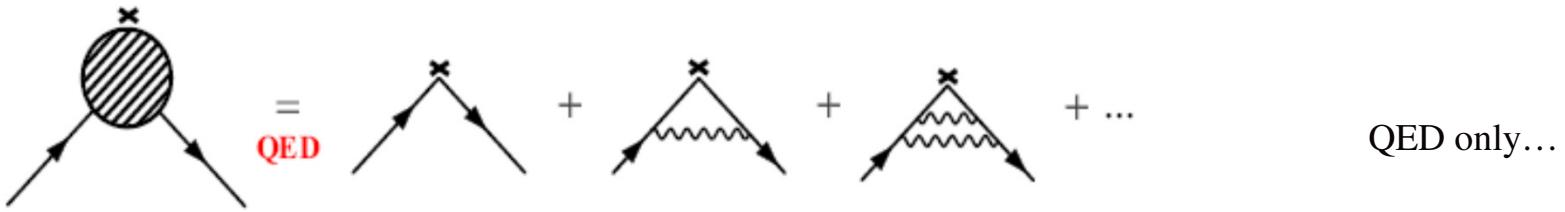

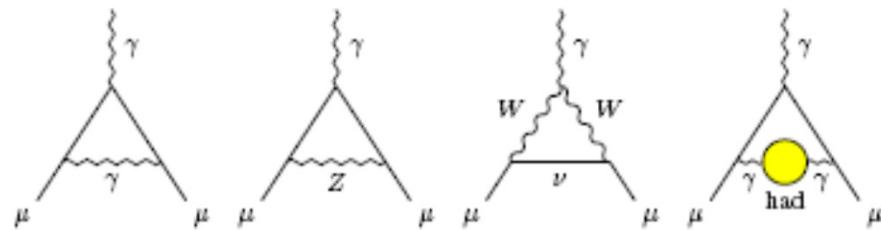

Figure 1: The perturbative expansion of $\Gamma^\rho(p', p)$ in single flavour QED. The tree graph gives $F_1 = 1$, $F_2 = F_3 = 0$. The one loop vertex correction graph gives the coefficient A_1 in Eq. (2.21). The cross denotes the insertion of the external field.

Electron $g-2$: Quantum Cyclotron

Clever use of magnetic and electric fields at low temperature: The *Penning Trap*

The Penning Trap

Penning Trap - Electrostatics

$$V(x, y, z) = V_0 \left(\frac{x^2 + y^2}{r_0^2} - \frac{z^2}{z_0^2} \right)$$

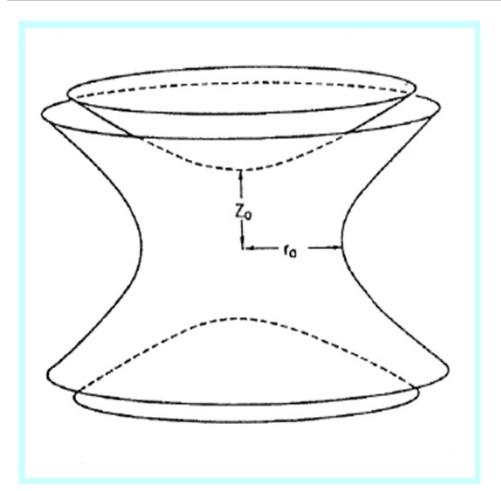

Equipotential surface:

$$\rightarrow \frac{x^2 + y^2}{r_0^2} - \frac{z^2}{z_0^2} = \pm 1 \text{ Hyperboloid of one, two sheets}$$

$$\rightarrow \mathbf{E} = -\nabla V$$

$$z_0 = \frac{r_0}{\sqrt{2}}$$

$$U = -eV_0 \left(\frac{r^2}{r_0^2} - \frac{z^2}{z_0^2} \right) \rightarrow \begin{matrix} r : \text{Inverted harmonic potential} \\ z : \text{Harmonic potential} \end{matrix}$$

Confining in z , not in r :

\rightarrow Add uniform magnetic field along z

Muon g -2: Experimental Method

$$\mu \approx \frac{e\hbar}{2mc} \text{ Magnetic moment}, j = \frac{1}{2}\hbar \text{ Spin}, \gamma \equiv \frac{\mu}{j} \text{ Gyromagnetic ratio}$$

$$\gamma \approx \frac{e\hbar}{2mc} \frac{2}{\hbar^{\text{natural units}}} = \frac{e}{2m} \cdot 2 \equiv g \frac{e}{2m} \rightarrow g \approx 2$$

$$a \equiv \frac{g - 2}{2} \ll 1 \text{ Anomaly}$$

For a charged particle moving in a uniform magnetic field:

$$\frac{d\mathbf{p}}{dt} = e(\mathbf{p} \times \mathbf{B}) \rightarrow \omega_c = \frac{eB}{m} \text{ Cyclotron frequency}$$

For a particle carrying a magnetic moment \boldsymbol{m} :

$$\left. \begin{aligned} \boldsymbol{\mu} &= \gamma \mathbf{J} \\ \boldsymbol{\tau} &= \boldsymbol{\mu} \times \mathbf{B} \\ \boldsymbol{\tau} &= d\mathbf{J}/dt \end{aligned} \right\} \rightarrow \frac{d\boldsymbol{\mu}}{dt} = \gamma(\boldsymbol{\mu} \times \mathbf{B}) \quad \text{Precession of } \boldsymbol{\mu} \text{ around } \mathbf{B} \text{ in the particle rest frame}$$

$$\omega_s = \frac{2\mu B}{\hbar} = g \frac{eB}{2m} = (1+a) \frac{eB}{m} \text{ Precession frequency}$$

Get a by measuring the *beat frequency* $\omega_s - \omega_c$ Lorentz invariant!

Larmor Precession

Just a short reminder of the classical result:

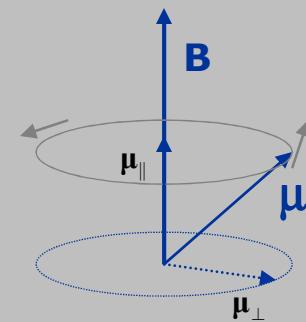

$$\frac{d\boldsymbol{\mu}}{dt} = \gamma(\boldsymbol{\mu} \times \mathbf{B}) \rightarrow \mathbf{B} \cdot \frac{d\boldsymbol{\mu}}{dt} = \gamma \mathbf{B} \cdot (\boldsymbol{\mu} \times \mathbf{B}) = 0 \rightarrow \mu_{\parallel} = \text{const}$$

$$\text{Say } \mathbf{B} = B \hat{k} \rightarrow \boldsymbol{\mu}_{\perp} = \mu_x \hat{i} + \mu_y \hat{j}$$

$$\rightarrow \frac{d\boldsymbol{\mu}_{\perp}}{dt} = \gamma(\boldsymbol{\mu}_{\perp} \times \mathbf{B}) \rightarrow \begin{cases} \frac{d\mu_x}{dt} = \gamma(\boldsymbol{\mu}_{\perp} \times \mathbf{B})_x = +\gamma\mu_y B \\ \frac{d\mu_y}{dt} = \gamma(\boldsymbol{\mu}_{\perp} \times \mathbf{B})_y = -\gamma\mu_x B \end{cases}$$

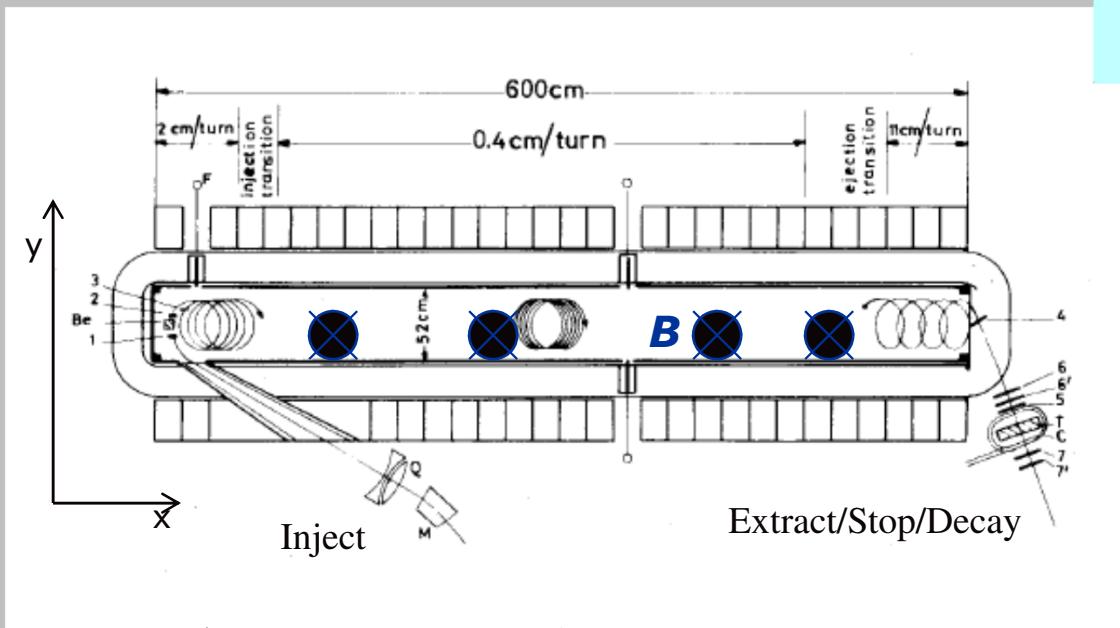

$$\tilde{\mu} \equiv \mu_x + i\mu_y \rightarrow \begin{cases} \frac{d\mu_x}{dt} = +\gamma\mu_y B \\ i\frac{d\mu_y}{dt} = -i\gamma\mu_x B \end{cases} \rightarrow \frac{d\mu_x}{dt} + i\frac{d\mu_y}{dt} = +\gamma B(\mu_y - i\mu_x) = -i\gamma B(\mu_x + i\mu_y)$$

$$\rightarrow \frac{d\tilde{\mu}}{dt} = -i\gamma B \tilde{\mu} \rightarrow \tilde{\mu}(t) = \tilde{\mu}_0 e^{-i\gamma B t} \rightarrow \begin{cases} \mu_x(t) = \mu_{x0} \cos \gamma B t \\ \mu_y(t) = -\mu_{y0} \sin \gamma B t \end{cases}$$

The Latest Muon $g-2$ at BNL - I

The Latest Muon $g-2$ at BNL - II

Scattering Spin $1/2$ - Spin $1/2$

Just to simplify things, take *different* spin $1/2$ particles (e.g. electron-muon scattering)

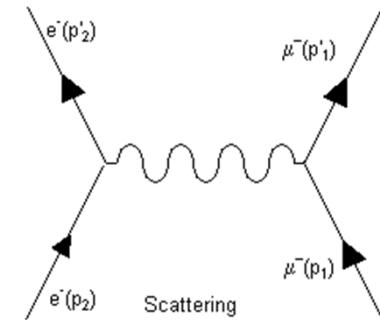

$$T_{fi}(s, s', r, r') = e \bar{u}'(p_2', s') \gamma^\mu u(p_2, s) \frac{g_{\mu\nu}}{q^2} \bar{u}'(p_1', r') \gamma^\nu u(p_1, r)$$

$$\frac{1}{4} \sum_{s,s',r,r'} |T_{fi}(s, s', r, r')|^2 = \frac{e^4}{q^4} L_{\mu\nu} M^{\mu\nu}$$

$$L^{\mu\nu} = 2 \left[p_1'^\mu p_1^\nu + p_1'^\nu p_1^\mu + \frac{q^2}{2} g^{\mu\nu} \right]$$

$$M_{\mu\nu} = 2 \left[p_{2\mu} p_{2\nu} + p_{2\nu} p_{2\mu} + \frac{q^2}{2} g_{\mu\nu} \right]$$

$$\rightarrow \frac{d\sigma}{d\Omega} \Big|_{LAB} \underset{E \gg m}{\simeq} \frac{\alpha^2 \cos^2 \theta/2}{4 |\mathbf{p}_1|^2 \sin^4 \theta/2} \frac{|\mathbf{p}_1'|}{|\mathbf{p}_1|} \left(1 - \frac{q^2 \tan^2 \theta/2}{2m_2^2} \right)$$

Yet another term...

Electron scattering off the muon *magnetic moment*

Interlude: Crossing Symmetry

Simple relationship between any pair of 2-body reactions

Define: Crossed particle \equiv Antiparticle

By changing the 4-momentum sign of the crossed particle, the two amplitudes are identical

$$A[a(p_A) + b(p_B) \rightarrow c(p_C) + d(p_D)] = A[a(p_A) + \bar{c}(-p_C) \rightarrow \bar{b}(-p_B) + d(p_D)]$$

e^+e^- Annihilation to $\mu^+\mu^-$

Apply crossing symmetry to electron-muon scattering

$$e^- + \mu^- \rightarrow e^- + \mu^-$$

A: Scattering

$$e^- + [e^-] \xrightarrow{\text{crossed}} [\mu^-] + \mu^- \equiv e^- + e^+ \rightarrow \mu^+ + \mu^- \quad \text{B: Annihilation}$$

Amplitude for scattering:

$$T_{fi}(s, s', r, r') = (-e) \bar{u}_{(\mu)}(p_2', s') \gamma^\mu u_{(\mu)}(p_2, s) \frac{-ig_{\mu\nu}}{q^2} (-e) \bar{u}_{(e)}(p_1', r') \gamma^\nu u_{(e)}(p_1, r)$$

$$q = p_1 - p_1' \rightarrow q^2 = (p_1 - p_1')^2 = p_1^2 + p_1'^2 - 2p_1 \cdot p_1'$$

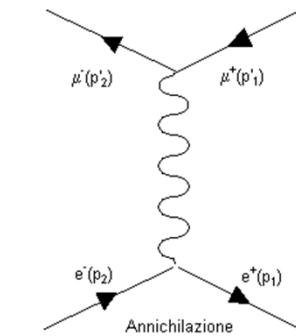

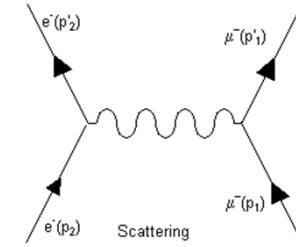

$$q^2 = 2m_e^2 - 2(E_1 E_1' - \mathbf{p}_1 \cdot \mathbf{p}_1') \underset{E \gg m}{\simeq} -2(E_1 E_1' - \mathbf{p}_1 \cdot \mathbf{p}_1') < 0 \quad q = \text{4-momentum transfer}$$

Amplitude for annihilation:

$$T_{fi}(s, s', r, r') = (-e) \bar{u}_{(\mu)}(p_2', s') \gamma^\mu v_{(\mu)}(p_1, r') \frac{-ig_{\mu\nu}}{q^2} (-e) \bar{v}_{(e)}(p_1, s) \gamma^\nu u_{(e)}(p_2, r)$$

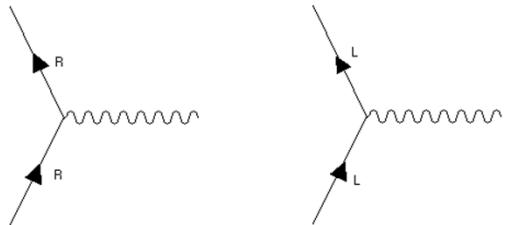

$$q = p_1 + p_2 \rightarrow q^2 = (p_1 + p_2)^2 = p_1^2 + p_2^2 + 2p_1 \cdot p_2$$

$$q^2 = 2m_e^2 + 2(E_1 E_2 - \mathbf{p}_1 \cdot \mathbf{p}_2) \underset{E \gg m}{\simeq} 2(E_1 E_2 - \mathbf{p}_1 \cdot \mathbf{p}_2) > 0 \quad q = \text{total 4-momentum}$$

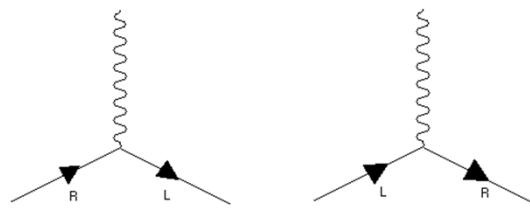

The Annihilation Cross-Section - I

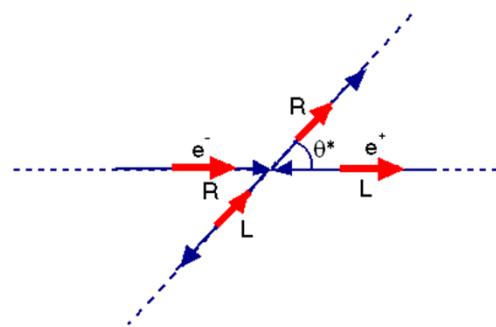

Helicity conservation at high energy:
Consequence of electromagnetic field being a *vector*

Scattering: $R \rightarrow R, L \rightarrow L$

Annihilation: $R+L, L+R$

For both initial and final state:
Particle and antiparticle must have *opposite* helicity
Decompose differential cross-section into 4 pieces:

$$\frac{d\sigma}{d\Omega^*} = \left(\frac{1}{4} \right) \left[2 \left[\frac{d\sigma}{d\Omega^*} \Big|_{LR \rightarrow LR} + \frac{d\sigma}{d\Omega^*} \Big|_{RL \rightarrow RL} \right] + \left[\frac{d\sigma}{d\Omega^*} \Big|_{LR \rightarrow RL} + \frac{d\sigma}{d\Omega^*} \Big|_{RL \rightarrow LR} \right] \right]$$

Average over initial states, Sum over final states

The Annihilation Cross-Section - II

Transition amplitude = Amplitude to find final particles at angle θ^ wrt to initial direction*

Phase space, incident flux and normalization factors just cancel out at high energy
 Matrix element:

$$T_{fi} = \frac{\alpha}{q^2 \equiv s} \cdot \text{Amplitude to find } J=1 \text{ state rotated by } \theta^*$$

Use rotation matrices for a $J=1$ state: Take y-axis \perp reaction plane

$$e^{-i\theta^* J_2} |J, m\rangle = \sum_{m'} d_{m,m'}^J(\theta^*) |J, m'\rangle, \quad d_{m,m'}^J(\theta^*) = \langle J, m | e^{-i\theta^* J_2} |J, m'\rangle$$

$$d_{+1,+1}^1(\theta^*) = d_{-1,-1}^1(\theta^*) = \frac{1}{2}(1 + \cos \theta^*)$$

$$d_{+1,-1}^1(\theta^*) = d_{-1,+1}^1(\theta^*) = \frac{1}{2}(1 - \cos \theta^*)$$

$$\left. \frac{d\sigma}{d\Omega^*} \right|_{LR \rightarrow RL} = \left. \frac{d\sigma}{d\Omega^*} \right|_{RL \rightarrow RL} = \frac{\alpha^2}{s} \left(\frac{1}{2} \right)^2 (1 + \cos \theta^*)^2 \\ \left. \frac{d\sigma}{d\Omega^*} \right|_{LR \rightarrow RL} = \left. \frac{d\sigma}{d\Omega^*} \right|_{RL \rightarrow LR} = \frac{\alpha^2}{s} \left(\frac{1}{2} \right)^2 (1 - \cos \theta^*)^2 \right\} \rightarrow \frac{d\sigma}{d\Omega^*} = \frac{\alpha^2}{4s} (1 + \cos^2 \theta^*)$$

$$\sigma = \int_{4\pi} \frac{\alpha^2}{4s} (1 + \cos^2 \theta^*) d\Omega^* = \frac{4\pi\alpha^2}{3s}$$

Nucleon Form Factors

Take the same current for the nucleon

$$j_p^\mu = e\bar{u}(p') \left(F(q^2) \gamma^\mu + G(q^2) i\kappa_p \sigma^{\mu\nu} q_\nu \right) u(p)$$

$$\kappa_p = ?$$

Anomalous magnetic moment
well measured, not understood

Anomaly originating from the extended shape of the proton, rather than radiative corrections

$$F_1(q^2) = F(q^2)$$

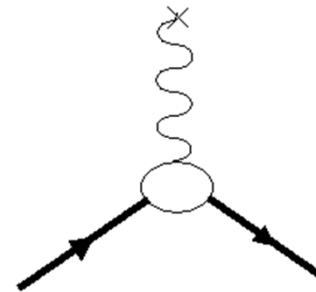

$$F_2(q^2) = 2MG(q^2)$$

$$\rightarrow j_p^\mu = e\bar{u}(p') \left(F_1(q^2) \gamma^\mu + \frac{i\kappa_p F_2(q^2)}{2M} \sigma^{\mu\nu} q_\nu \right) u(p)$$

Redefine:

$$G_E(q^2) = F_1 + \frac{\kappa_p q^2}{4M^2} F_2 \quad \text{Electric form factor}$$

$$G_M(q^2) = F_1 + \kappa_p F_2 \quad \text{Magnetic form factor}$$

Blob indicates a non-QED vertex

4-momentum conservation at the nucleon vertex

$$P + q = P'$$

$$\rightarrow (P + q)^2 = P'^2 \rightarrow P^2 + q^2 + 2P \cdot q = P'^2$$

$$P^2 = P'^2 = M^2$$

$$\rightarrow 2P \cdot q = -q^2$$

Rewrite in the LAB frame, take massless lepton

$$P = (M, \mathbf{0})$$

$$p = (E, \mathbf{p}) \approx (|\mathbf{p}|, \mathbf{p}), \quad p' \approx (|\mathbf{p}'|, \mathbf{p}')$$

$$q = p - p'$$

$$\rightarrow q^2 \approx (|\mathbf{p}| - |\mathbf{p}'|, \mathbf{p} - \mathbf{p}')^2 = |\mathbf{p}|^2 + |\mathbf{p}'|^2 - 2|\mathbf{p}||\mathbf{p}'| - (|\mathbf{p}|^2 + |\mathbf{p}'|^2 - 2\mathbf{p} \cdot \mathbf{p}')$$

$$\rightarrow q^2 \approx (|\mathbf{p}| - |\mathbf{p}'|, \mathbf{p} - \mathbf{p}')^2 = -2|\mathbf{p}||\mathbf{p}'| + 2\mathbf{p} \cdot \mathbf{p}' = -2|\mathbf{p}||\mathbf{p}'|(1 - \cos \theta) = -4|\mathbf{p}||\mathbf{p}'|\sin^2 \theta/2$$

$$Q^2 \equiv -q^2$$

$$P \cdot q \approx (M, \mathbf{0}) \cdot (|\mathbf{p}| - |\mathbf{p}'|, \mathbf{p} - \mathbf{p}') = M (|\mathbf{p}| - |\mathbf{p}'|)$$

$$\nu \equiv |\mathbf{p}| - |\mathbf{p}'| \rightarrow P \cdot q \approx M\nu$$

Rosenbluth Again - I

Rewrite electron-muon differential cross-section in LAB:

$$\frac{d^2\sigma}{d\Omega} \underset{E \gg m}{\simeq} \underbrace{\frac{\alpha^2 \cos^2 \theta/2}{4E^2 \sin^4 \theta/2}}_{\text{Mott}} \underbrace{\frac{E'}{E}}_{\text{Recoil}} \left(1 - \underbrace{\frac{q^2}{2m_\mu^2} \tan^2 \theta/2}_{\text{Magnetic dipole}} \right)$$

as follows :

$$\begin{aligned} \frac{d^2\sigma}{d\Omega} &= \int dE' \frac{d^3\sigma}{dE' d\Omega} \\ \frac{d^3\sigma}{dE' d\Omega} &= \frac{\alpha^2 \cos^2 \theta/2}{4E^2 \sin^4 \theta/2} \left(1 - \frac{q^2}{2m_\mu^2} \tan^2 \theta/2 \right) \delta\left(\nu + \frac{q^2}{2m_\mu}\right) \\ q^2 &\simeq -4EE' \sin^2 \theta/2 \\ \nu = E - E' &\quad \left. \right\} \rightarrow \delta\left(\nu + \frac{q^2}{2m_\mu}\right) = \delta\left(E - E' - \frac{2E}{m_\mu} E' \sin^2 \theta/2\right) \end{aligned}$$

Namely,

$q^2, \nu \leftrightarrow E', \theta$ fully correlated by 4-momentum conservation

Rosenbluth Again - II

Electron-proton, following the same path as before:

$$\frac{d^3\sigma}{dE'd\Omega} = \frac{\alpha^2 \cos^2 \theta/2}{4E^2 \sin^4 \theta/2} \left[\frac{G_E^2(q^2) - \frac{q^2}{4M^2} G_M^2(q^2)}{1 - \frac{q^2}{4M^2}} - \frac{q^2}{2M^2} G_M^2(q^2) \tan^2 \theta/2 \right] \delta\left(\nu + \frac{q^2}{2M}\right)$$
$$\rightarrow \frac{d^3\sigma}{dE'd\Omega} = \frac{\alpha^2 \cos^2 \theta/2}{4E^2 \sin^4 \theta/2} \left(A + B \tan^2 \theta/2 \right) \delta\left(\nu + \frac{q^2}{2M}\right)$$

Scattering by a point-like source (e.g. muon) recovered by taking

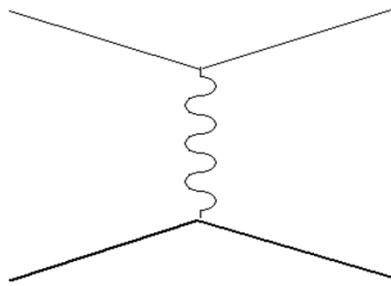

$$\begin{cases} \frac{G_E^2(q^2) - \frac{q^2}{4M^2} G_M^2(q^2)}{1 - \frac{q^2}{4M^2}} = 1 \\ G_M^2(q^2) = 1 \end{cases}$$

→ Point-like scatterer:

$$G_E^2(q^2) = G_M^2(q^2) = 1$$

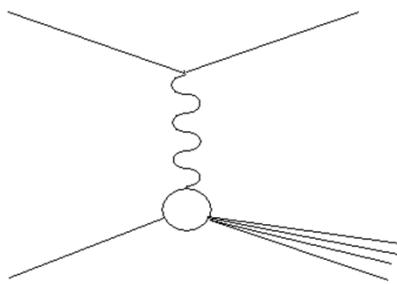

Inelastic Scattering

Elastic:

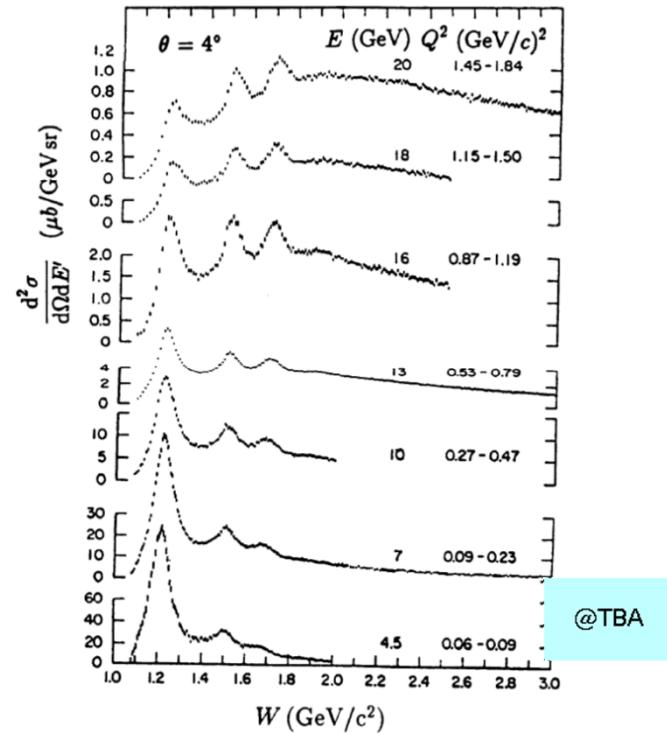

Invariant mass = M

Generalise to inelastic reactions:

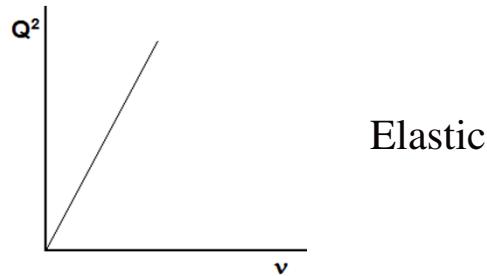

Invariant mass = $W > M$

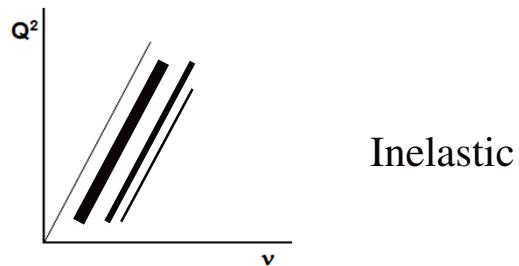

Copious production of *resonances* (nucleon excited states), when q^2 not too big

Inelastic Scattering Kinematics

$$\nu = \frac{Q^2}{2M} \rightarrow 2M\nu = Q^2$$

$$2M\nu = Q^2 + M'^2 - M^2$$

Generalise Rosenbluth cross-section to account for variable W :

Introduce inelastic *structure functions* W_1, W_2 to replace elastic form factors G_E, G_M

$$\frac{d\sigma}{d\Omega dE'} = \frac{\alpha^2 \cos^2 \theta/2}{4E^2 \sin^4 \theta/2} [W_2(\nu, q^2) + W_1(\nu, q^2) \tan^2 \theta/2]$$

$W_{1,2}$ depending on q^2 and ν

Deep Inelastic Scattering - I

Details of structure functions in the resonance region difficult to explain
But: Beyond small q^2, ν things are surprisingly simple!

Striking elastic/deep inelastic comparison:
no q^2 dependence in DIS

Deep Inelastic Scattering - II

$$\frac{d^2\sigma}{dE'd\Omega} \rightarrow \frac{d^2\sigma}{dq^2d\nu}$$

Also introduce:

$$\begin{cases} x = \frac{Q^2}{2M\nu} \\ y = \frac{\nu}{E_1} \end{cases} \rightarrow \frac{d^2\sigma}{dxdy} = \frac{4\pi\alpha^2 ME_1}{Q^4} \left[2xF_1\left(\frac{1+(1-y)^2}{2}\right) + (1-y)(F_2 - 2xF_1) - \frac{M^2 xy F_2}{s-M^2} \right]$$

Bjorken scaling hypothesis:

$$\frac{d^2\sigma}{dQ^2d\nu} \xrightarrow[q^2, \nu \rightarrow \infty]{\frac{q^2}{\nu} \text{ finite}} f(x), \quad x = \frac{Q^2}{2M\nu}$$

$f(x)$ Universal function of x

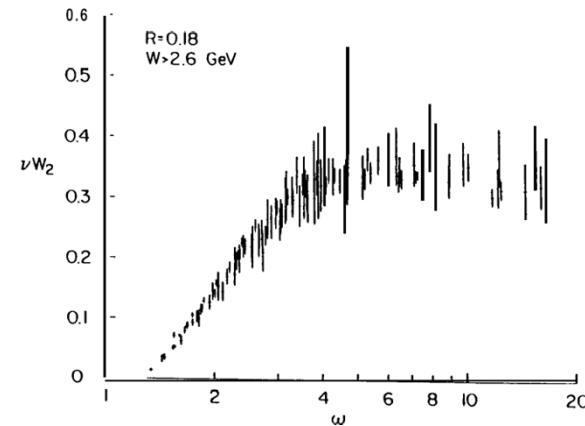

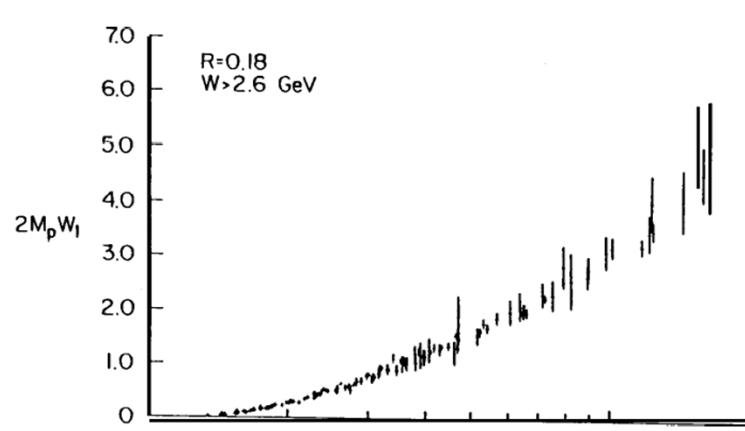

$f(x)$ Q^2 independent

Deep Inelastic Scattering - III

Expect:

$$\begin{cases} F_1(x, Q^2) \rightarrow F_1(x) \\ F_2(x, Q^2) \rightarrow F_2(x) \end{cases} \text{ if scaling is good}$$

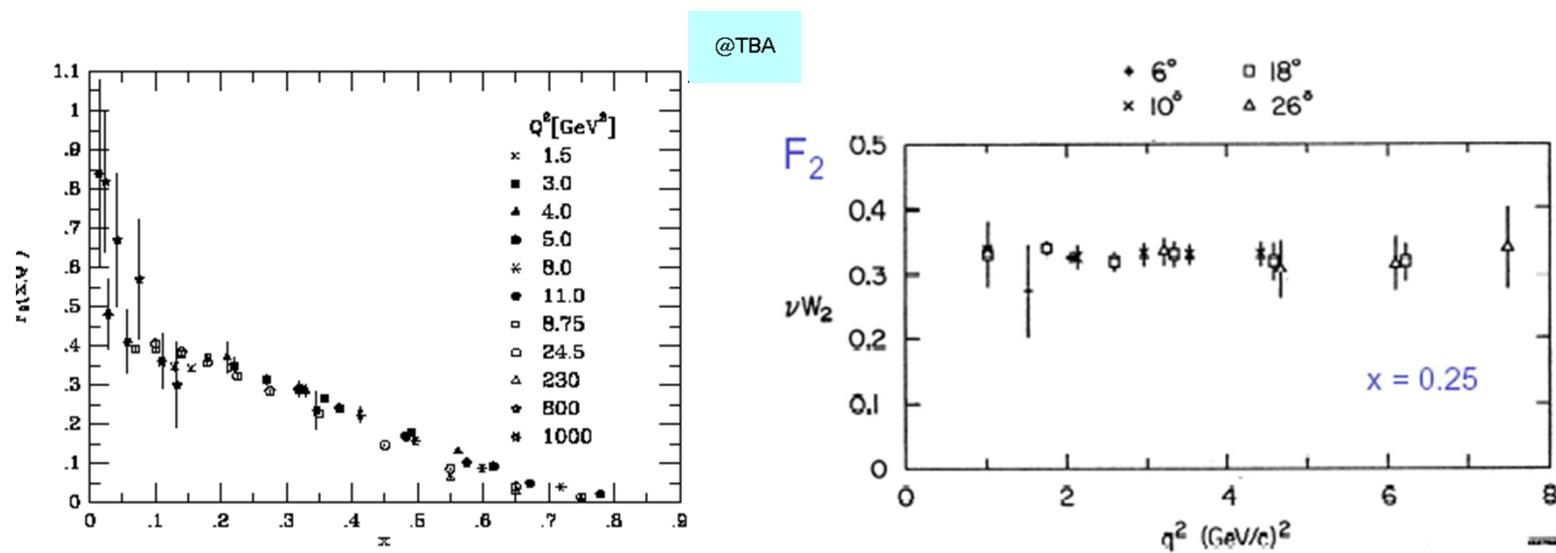

Observe ($\omega = 1/x$):

Scaling at high energy is indeed well verified!

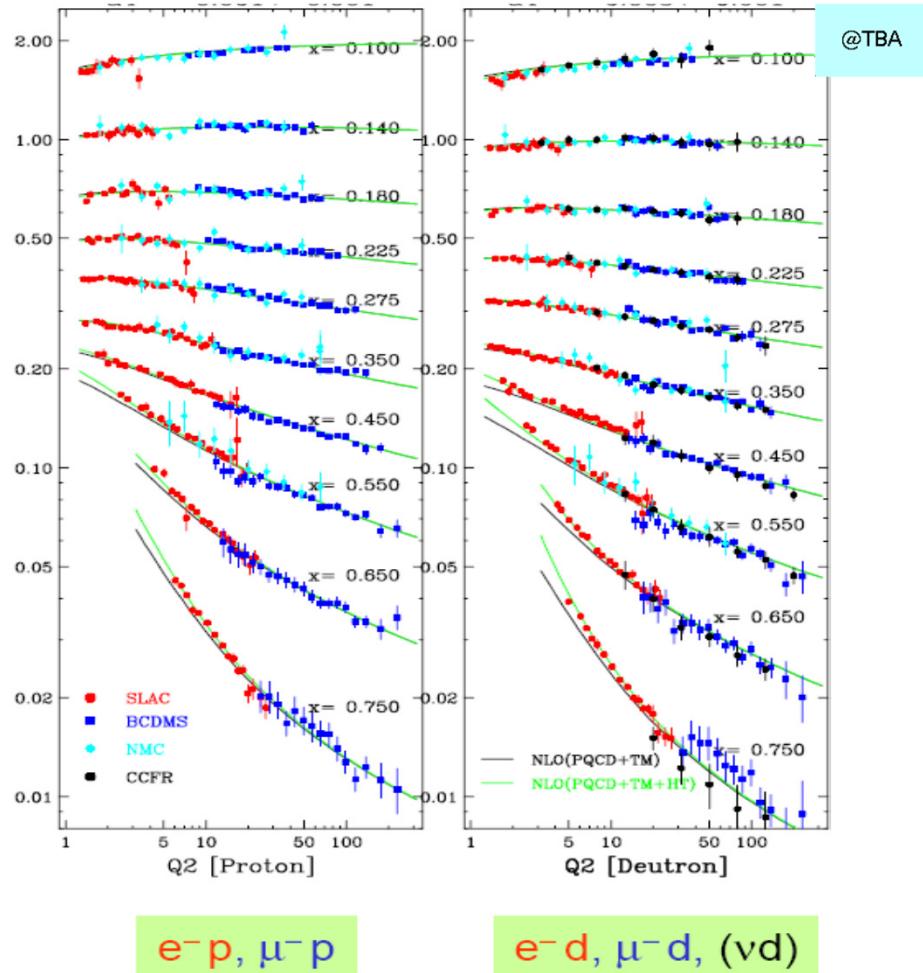

Deep Inelastic Scattering - IV

W_2 : Universal function of x q^2 -independent!

As compared to fast varying elastic f.f., just astonishing...

Scaling Violations

Extensive compilation
Data from fixed target experiments
Observe:

Electron vs. Muon

Red points are from electron DIS

Blue points are from muon DIS

Muon merits:

Easier to get high energy
Reduced radiative corrections

Muon drawbacks:

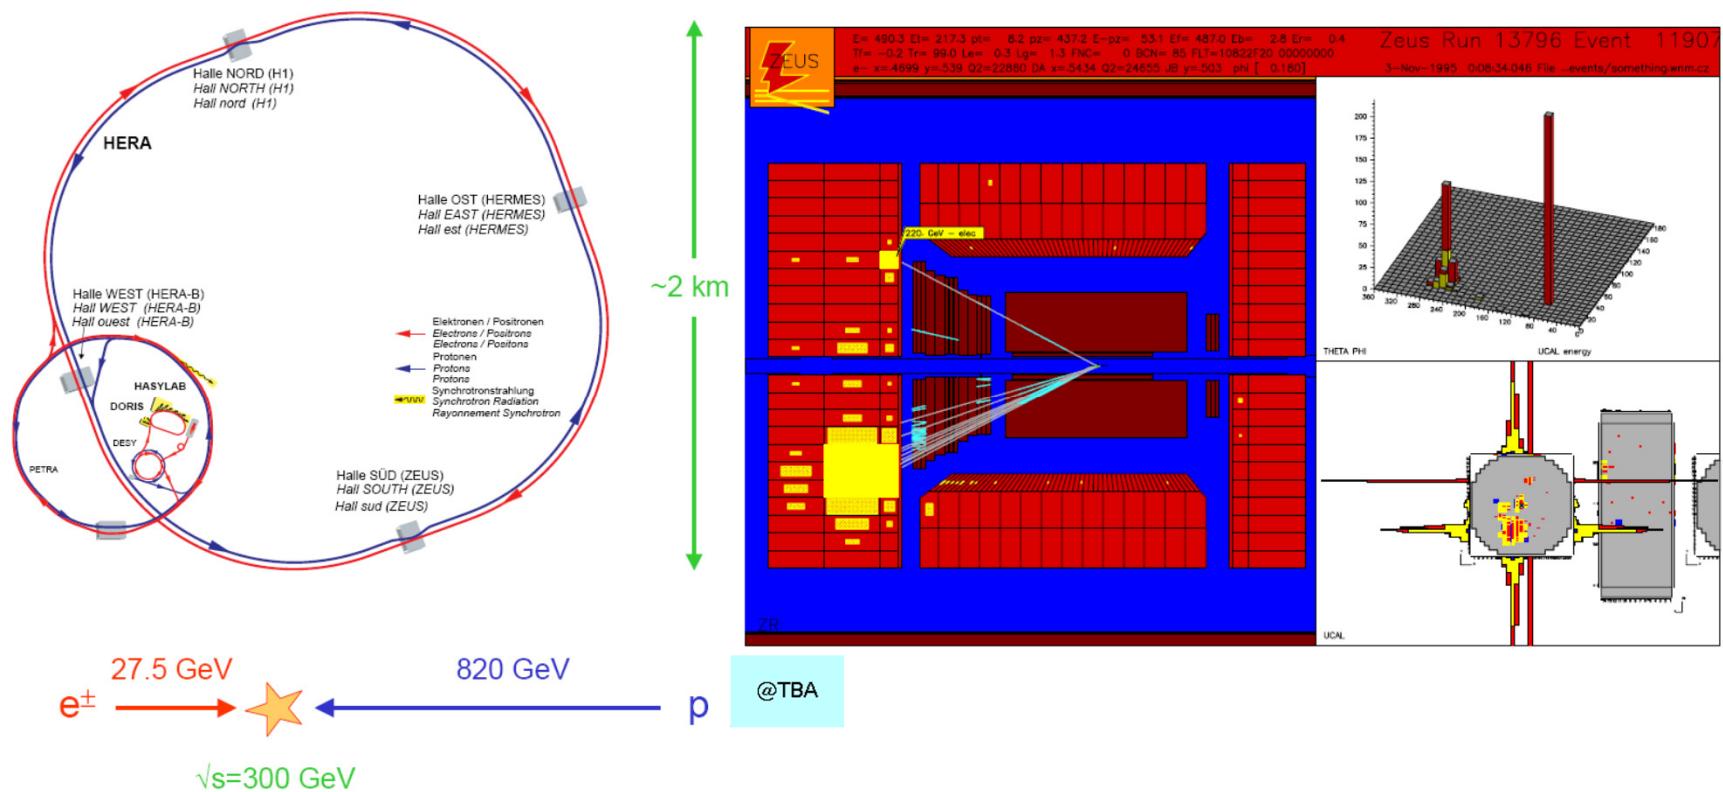

Intensity

Proton (L) vs. Deuteron (R)

Get *neutron* structure function

HERA

First example of *asymmetric* collider

A Recent Compilation

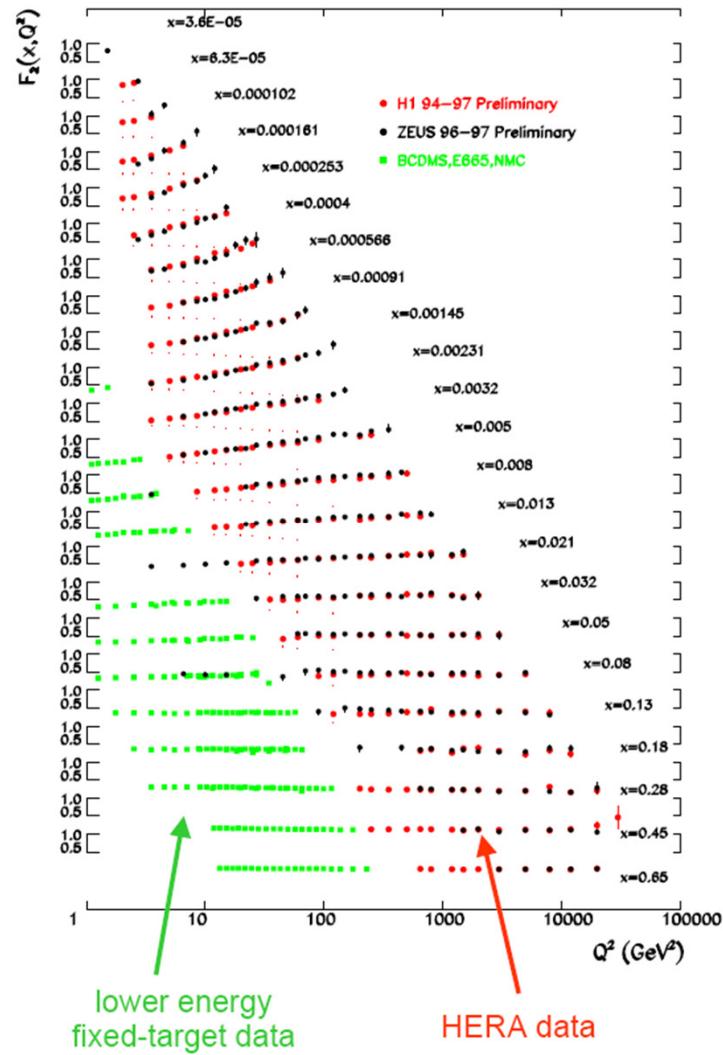

Results from several experiments:

muon DIS NMC, BCDMS, E665
CERN FNAL
electron DIS at HERA collider
DESY

Huge q^2, x range

Small, measurable scaling violation
Interesting features at small x

→ QCD !

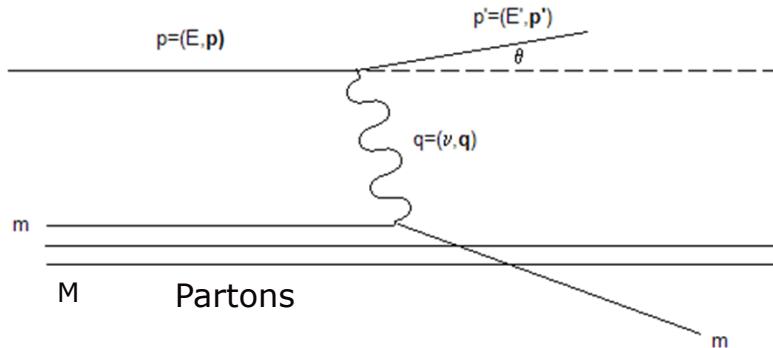

Parton Model - I

Structure functions generalise form factors

Form factor of a point source = *constant*

Feynman suggestion:

Maybe deep inelastic scaling just indicates elastic scattering off free, pointlike constituents

Kinematical constraint:

$$m = (m + \nu, \mathbf{q})^2 = m^2 + 2m\nu + \frac{\nu^2 - |\mathbf{q}|^2}{= q^2}$$

$$\rightarrow \nu + \frac{q^2}{2m} = 0$$

Parton Model - II

Elastic scattering off a parton: Energy and angle of the scattered electron *fully correlated*

Differential cross-section for elastic scattering off a free, pointlike constituent of mass m

$$\frac{d\sigma}{d\Omega} = \int dE' \frac{d^3\sigma}{dE' d\Omega} = \int dE' \frac{\alpha^2 z^2}{4E^2 \sin^4 \theta/2} \left(\cos^2 \theta/2 - \frac{q^2}{2m^2} \sin^2 \theta/2 \right) \delta\left(\nu + \frac{q^2}{2m}\right)$$

z : Parton charge, units e

Full E' , θ correlation

$$\begin{cases} \nu = E - E' \\ q^2 = -4EE' \sin^2 \theta/2 \end{cases} \rightarrow E - E' = \frac{4EE' \sin^2 \theta/2}{2m} \rightarrow E' \left(1 + \frac{4E}{2m} \sin^2 \theta/2 \right) = E$$

$$\rightarrow E' = \frac{E}{1 + \frac{4E}{2m} \sin^2 \theta / 2}$$

$$\nu + \frac{q^2}{2m} = 0, x = -\frac{q^2}{2M\nu} \rightarrow x = \frac{m}{M}$$

$$\frac{d^2\sigma}{dE'd\Omega} = \frac{\alpha^2 z^2}{4E^2 \sin^2 \theta/2} \left(\cos^2 \theta/2 - \frac{q^2}{2M^2 x^2} \sin^2 \theta/2 \right) \delta\left(\nu + \frac{q^2}{2Mx}\right)$$

Parton Model - III

Summing over all types of partons

$$\frac{d^2\sigma}{d\Omega dE'} = \frac{\alpha^2 \sum_i z_i^2 n_i}{4E^2 \sin^2 \theta/2} \left(\cos^2 \theta/2 - \frac{q^2}{2M^2 x^2} \sin^2 \theta/2 \right) \delta\left(\nu + \frac{q^2}{2Mx}\right)$$

Compare to inelastic cross-section

$$\frac{d\sigma}{d\Omega dE'} = \frac{\alpha^2}{4E^2 \sin^4 \theta/2} [W_2(\nu, q^2) \cos^2 \theta/2 + W_1(\nu, q^2) \sin^2 \theta/2]$$

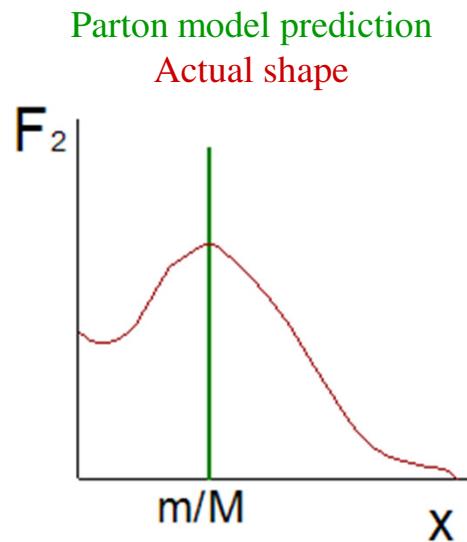

Then predict structure functions:

$$\rightarrow \begin{cases} W_2 = \frac{F_2}{\nu} = \left(\sum_i z_i^2 n_i \right) \delta\left(\nu + \frac{q^2}{2Mx}\right) \\ W_1 = \frac{2F_1}{M} = \left(\sum_i z_i^2 n_i \right) \left(\frac{-q^2}{2M^2 x^2} \right) \delta\left(\nu + \frac{q^2}{2Mx}\right) \end{cases}$$

Parton Model - IV

$$\rightarrow F_2 = \nu \left(\sum_i z_i^2 n_i \right) \delta \left(\nu + \frac{q^2}{2Mx} \right) = \left(\sum_i z_i^2 n_i \right) \delta \left(1 + \frac{q^2}{2Mx\nu} \right)$$

$$\rightarrow F_2 = \left(\sum_i z_i^2 n_i \right) x \delta \left(x + \frac{q^2}{2M\nu} \right) = \left(\sum_i z_i^2 n_i \right) x \delta \left(x - \frac{m}{M} \right)$$

Parton Model - V

The true meaning of x

P, q : proton, virtual photon 4-momenta

$$x = \frac{Q^2}{2M\nu} = \frac{Q^2}{2P \cdot q} \text{ invariant}$$

$$x = \frac{m}{M}$$

$$m^2 = x^2 M^2 = x^2 (E^2 - \mathbf{p}^2)$$

$$m^2 = (E_{parton}, \mathbf{p}_{parton})^2 = E_{parton}^2 - \mathbf{p}_{parton}^2$$

$$(E_{parton}, \mathbf{p}_{parton}) = x \cdot (E, \mathbf{P})$$

$$\rightarrow \mathbf{p}_{parton} \approx x \cdot \mathbf{P} \text{ when } m \ll |\mathbf{p}|$$

Therefore, in the *(Proton) Infinite Momentum Frame*:

x is the momentum fraction carried by the struck parton

Parton Model - VI

Lot of insight in this limit (Feynman):

$\beta \rightarrow 1 \Rightarrow \gamma \rightarrow \infty$ Large time dilation

Time constants of internal motions: $\tau \rightarrow \infty$ in the IMF

Constituents seen as *still* by the DIS virtual photon

Use time-energy indeterminacy relation:

$$P = \left(E_p, \underset{\text{comp. trasversa}}{0}, |\mathbf{P}| \right), \quad E_p = \sqrt{M^2 + |\mathbf{P}|^2} \approx |\mathbf{P}|$$

$$q = (E_\gamma, \mathbf{q}_T, 0)$$

$$\rightarrow P \cdot q \approx |\mathbf{P}| E_\gamma \rightarrow E_\gamma \approx \frac{P \cdot q}{|\mathbf{P}|} = \frac{Q^2}{2x|\mathbf{P}|}$$

$$\tau_0 \sim \frac{1}{E_\gamma} \approx \frac{2x|\mathbf{P}|}{Q^2} \quad \text{DIS time scale}$$

$$\tau \sim \frac{1}{\Delta E} \approx \frac{2x|\mathbf{P}|}{p_T^2} \quad \text{Constituents motion time scale}$$

p_T : parton transverse momentum scale

$$\rightarrow \frac{\tau_0}{\tau} \approx \frac{p_T^2}{Q^2} \sim 0$$

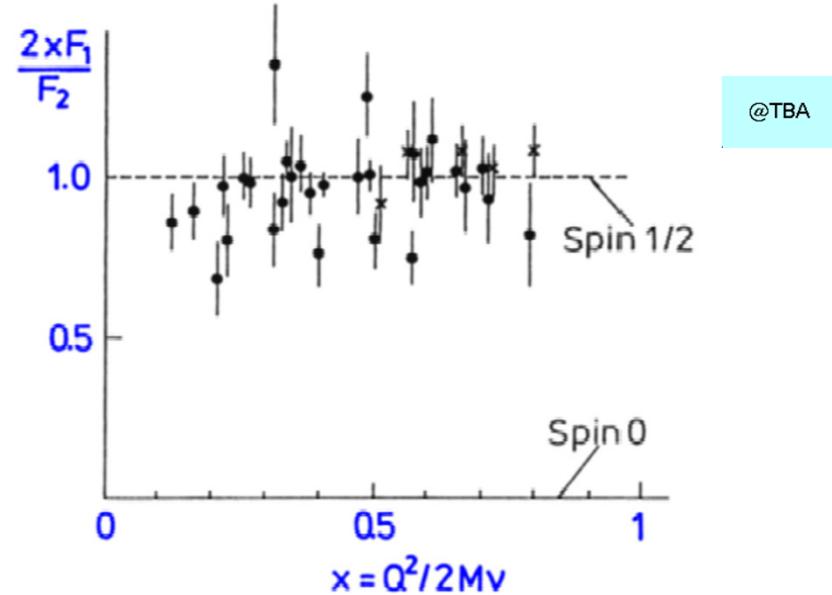

No binding effects, free constituents OK

Parton Model - VII

Callan-Gross relation for spin 1/2 partons

$$\begin{cases} \frac{F_2}{\nu} = \left(\sum_i z_i^2 n_i \right) \delta \left(\nu + \frac{q^2}{2Mx} \right) \\ \frac{2F_1}{M} = \left(\sum_i z_i^2 n_i \right) \left(\frac{-q^2}{2M^2 x^2} \right) \delta \left(\nu + \frac{q^2}{2Mx} \right) \\ \rightarrow \frac{F_2}{\nu} = \frac{2F_1}{M} \frac{2M^2 x^2}{-q^2} = \frac{2F_1}{M} \frac{2M^2 x^2}{2M\nu x} = \frac{2F_1 x}{\nu} \end{cases}$$

$$\rightarrow F_2 = 2F_1 x$$

Parton Model - VIII

Several unanswered questions...

Most important issues:

One does not observe any free constituent out of the collision

Constituents seem to be essentially free (as partons) and tightly bound (as never observed free outside the nucleon) at the same time

For some time, these points were believed to rule out any constituent model
