Key Points

Guidelines:

*Little interference with the (many) theoretical courses
'Experimental/Phenomenological', whatever it means*

Difficult task (for both students *and* teacher):

*Experimental particle physics is notoriously difficult to either teach or learn
in a classroom*

*Today's large experiments and machines operating conditions are quite far
from common experience, filled with extreme technology, sometimes hard to
understand at first contact*

Goal definitely worth the effort:

Exploration, Validation and Extension of the SM

One of the most exciting intellectual challenges/time killers available on the market
